1. **Visit-to-visit Variability in A Systolic Blood Pressure is a Novel Risk Factor for the Progression of Coronary Artery Calcification.**

2. **Relationship between cardio-ankle vascular index (CAVI) and coronary artery calcification (CAC) in patients with type 2 diabetes mellitus.**

3. **Low insulin level is associated with aortic stiffness.**

4. **Very late stent thrombosis predicted by multislice computed tomography.**

5. **U-shaped relationship between insulin level and coronary artery calcification (CAC).**

6. **Low serum bilirubin concentration is associated with coronary artery calcification (CAC).**

7. **Evaluation of characteristics and degree of remodeling in coronary atherosclerotic lesions by 64-detector multislice computed tomography (MSCT).**
